

## ABSTRACT OF THE DISCLOSURE

In a three-dimensional object image print service system capable of printing out a desired three-dimensional object image, a three-dimensional image display apparatus includes a three-dimensional object image generator for generating a three-dimensional object image, based on instructions from an input device operated by a user and a three-dimensional object image generation program previously provided. The three-dimensional image display device further includes a selector for selecting arbitrary part of the three-dimensional object image generated based on instructions from the user, and a transition information generator for generating transition information of a three-dimensional object image representing the selected arbitrary part of the three-dimensional object image. The three-dimensional object image arbitrarily selected by the user can be reproduced based on the transition information and the three-dimensional object image generation program.
